Abstract

The proposed software project "Stylize" is being created in response to the expanding need for thorough and user-centric e-commerce platform in the fashion industry. Stylize strives to bridge the gap between consumers and retailers, offering a unique shopping experience that leverages user preferences and provides retailers with valuable insights to enhance their business operations. It is difficult for customers to locate apparel, accessories, and shoes that match their size and fashion choices due to the lack of personalization in current online purchasing. The traditional e-commerce model relies on static product images, leading to uncertainty in customers' purchasing decisions. Moreover, customers have to physically visit stores to try on clothes or accessories, which can be time-consuming and inconvenient. Stylize will enable users to find outfits and accessories that align with their size and styling preferences, thereby simplifying the shopping process. The platform will enable data driven decision-making for retailers by giving them access to inventory management tools, analytics, and sales performance reports. The need that the proposed project will fill is the lack of a comprehensive e-commerce solution that serves both consumers and retailers, provides a unified and personalized shopping experience, and improves the operational efficiency of enterprises in the fashion industry. The main key objectives of the proposed project are to make it simple for consumers to locate products that meet their size and fashion preferences. The secondary goal is to provide retailers with tools for effective inventory management and insightful analytics. The main objective of the initiative is to increase user involvement by providing tools like wish lists, outfit mixing and matching, virtual try-on, and profile personalization. The project's importance lies in its potential to completely transform the e-commerce fashion industry. By catering to the needs of both consumers and retailers, it promises a more personalized shopping experience for users and improved business operations for retailers, ultimately transforming the way fashion is bought and sold in the digital age.

1. Introduction

This project proposal document outlines the creation of an e-commerce website and mobile application that will transform the fashion retail industry by providing an innovative and comprehensive platform for both users and retailers. The suggested approach tries to overcome the issues with the conservative e-commerce paradigm while also giving customers a more engaging and personalized buying experience. This platform serves as a virtual mall, providing a wide selection of clothing and accessories from different brands to suit the diverse interests and preferences of consumers. The system will give users more control over their shopping experience by letting them add their sizes and get outfit, accessories and shoes suggestions that are based on their measurements and styling preferences. Additionally, users can mix and match items from their inventory to create their own distinctive looks and try them on virtually. On the other side, retailers will have access to powerful inventory management technologies that will let them easily track and manage their inventories. Retailers can also access sales performance and detailed analytics reports, facilitating data-driven decision-making and strategy development. Detailed analytics and sales performance reports will also be beneficial to them, enabling data-driven decision-making. Users have full control over their profiles, allowing them to curate their preferences and ensure a personalized shopping journey. Additionally, the system provides a notification feature, telling users when items they have added to their Wishlist become available for purchase or go on sale, enhancing the overall shopping experience.

2. Problem Statement

Online shopping platforms have seen major enhancement in past years. However, the fashion retail industry faces numerous challenges as in putting forward a personalized and seamless shopping experience for both sellers and buyers. Often, buyers face problems in finding styling items like clothes, accessories, and shoes that are according to their body measurements and styling preferences, causing dissatisfaction with the purchases. The hardness in finding the right sizes varying among brands, absence of personalized recommendations, and the failure of clients to try fits prior to buying results in high rate of exchanges and returns due to which not only shoppers are subjected to frustration but also the sellers in the face of high expenditures because of shipping fees and restocks. Moreover, an incommodious process for shoppers is creating outfits, mixing and matching items from different stores and brands to form a complete look is a hassle. They have to visit numerous sites or search through various listings of products to track down matching pieces, even in stores customers cannot leave an outlet with the product before purchasing it, they have to roam around other outlets in a mall to match different products from different brands/shops. All of this becomes a hassle and brings about monetary misfortunes for the shopper especially when there are no or strict return and exchange policies. They also face issues of products running out of stock quickly and miss sales. Further, sellers struggle in efficient inventory management, frequently raising problems of understocking/overstocking. Sale opportunities are lost by understocking while overstocked items become a result of markdown. Rapid changes in fashion trends and customer preferences become a challenge for sellers in understanding and responding to them. Without having accurate perceptions or insights, they may spend wrong, buying less beneficial products and missing out on worthwhile opportunities. A significant amount of time is spent by online as well as in-store shoppers searching for products, lack of personalized recommendations, and inaccurate fittings results in a high rate of

returns and exchanges. Additionally, sellers face a huge overstocking/understocking issue, leading to monetary losses. All of this impacts the online shopping world.

3. Problem Solution/Objectives of the Proposed System

Many customers who prefer online shopping seek satisfactory products and seamless experience, retailers who require better management of their orders, sales, and revenue by ease and comfort of being home. The stylize software system brings forward a complete solution. This platform encompasses features that are aimed for the provision of streamlined inventory and order management solving stocking issues and assisting retailers to understand various trends, personalized recommendations, size guides and much more to help in improving online shopping experience and achieving customer satisfaction. The system offers buyers customized product suggestions according to their styling preferences and precise body measurements, lessening returns/exchanges and dissatisfaction, ensuring a high profits and satisfaction with purchases. Users can easily put together ensembles using the system's designated space and their collection of styling items. This makes the mix-and-match process efficient and fun and spares customers from the tiresome process of traversing several websites or outlets. It additionally eliminates the need to visit numerous web pages or stores. Users can take style quizzes, receive brand recommendations, and receive personalized product recommendations based on their tastes. Additionally, utilizing the AR technology, advanced try-on feature will permit customers to envision themselves wearing the garments prior to purchasing. By utilizing their gadget's camera, customers can perceive how the dress looks and fits their body type, empowering them to make better buying decisions. Real-time inventory monitoring assists sellers in avoiding overstocking and understocking difficulties. The order management module's integration ensures effective stock changes. In order to make wise decisions and respond to trends, the system gives vendors essential insights into sales patterns and buyer behavior. By overcoming these issues, stylize intends to transform the online retailing of fashion experience, enhancing it for both buyers and sellers and revitalizing the perception of online fashion purchasing as a whole. While retailers may streamline their processes and adjust to shifting market trends, customers can receive a personalized, effective, and delightful shopping experience.

3.1 Objectives

BO-1: Boost customer engagement for retailers to boost sales.
BO-2: Enhance inventory management and lessen overstocking and understocking.
BO-3: Increase patronage by providing a sophisticated shopping experience.
BO-4: Cut back on necessary costs associated with handling returned goods.
BO-5: Improve the reputation and standing of the brands.
BO-6: Increase the effectiveness of inventory management.
BO-7: Make the purchasing experience better overall.
BO-8: Improve user discovery of brands.
BO-9: Reduce the amount of time shoppers spend looking for items.

4. Related System Analysis/Literature Review

Table 1 Related System Analysis with proposed project solution

Application Name	Weakness	Proposed Project Solution

Ishopping	• The application doesn't provide any size measurements, try-on feature and styling preferences to users. • The application doesn't have a proper mix and match feature for users to style their own outfit or see matching accessories. • There are no personalized notifications for users.	• Our website/application will provide users with proper size measurements, virtual try-on and styling preferences. • User will be able to style different outfits together they will be able to control their own profile. • Our website/application will provide user with personalized notifications about sales and discounts on specific outfits and accessories they wish to buy.
CLO-Z (Virtual try-on technology for clothes)	• The website/application lacks a proper brand management. There's no specific brand. • The application's performance is slow, when user try clothes on them the camera frequently gets stuck which may be frustrating for the user.	• Our website/application allow brands to make their account and utilize numerous features on their branding pages within the app. • The application's code and resources must be optimized to cut down on load times, lag and lower the possibility of crashes in order to address performance issues
Virtual Dressing Room	• The application doesn't take user's measurements. • This app also doesn't have a proper brand management. It just shows app generated clothes.	• Our application will provide a feature which will take user's measurements and will recommend them outfits and accessories according to their styling and size. • Our application will offer numerous products varying among brands. Consequently, complete inventory management for various retailers.

5. Vision Statement

For customers and retailers who seek a personalized, modern and efficient e-commerce solution and wants AR based web and mobile application that is a revolutionary and inclusive fashion ecosystem that seamlessly merges the digital and physical realms, offering a deeply personalized and transformative shopping experience to users by the best fits and accessories according to their body measurements also allowing the customers to mix and match their outfits according to their preferences, try them virtually and make satisfied purchases while empowering retailers with unparalleled insights and efficiency. It visualizes a future where the act of buying and selling fashion becomes an intelligent, immersive, and truly collaborative experience understanding the desires of fashion-forward consumers who seek not just products but personalized style journeys, and of retailers who strive to thrive in a data-driven, dynamic market. Unlike conventional e-commerce platforms that lack virtual try rooms, personalization, and retail management integration. Our product is composed to redefine the fashion industry by harnessing cutting-edge technology to curate outfit and accessories recommendations tailored to each user's unique size and styling preferences closing the gap between fashion and technology in a way that has never been done before enabling buyers to try attires virtually and experiment with them before making a purchase, which will save them time, money, making them confident and satisfied with their purchases, while also reducing the number of returns and financial losses for e-commerce fashion retail businesses.

6. Scope

Stylize is a platform that helps its customers with their online shopping. It is primarily a solution for individuals who want to shop comfortably and easily for best-fits. The system offers cutting-edge capabilities to assist buyers in making wise judgments and spending appropriately while doing their online shopping, leaving no room for regret. By giving an analysis of their inventory and orders, letting their buyers experience a more engaging environment, and reducing many of the current problems associated with online sales, the system also benefits online retailers. Admin has a business advantage to earn through platform fees. They log in the system, view buyer and retailer accounts and manage them accordingly through monitoring and restricting. Further they can update their bank details and view their total earnings. Buyers get product recommendations and notifications. They have the ability to establish and maintain personalized profiles, and search history. They can make a wish list as well. Moreover, the customers can use the try-on feature available with the products to examine how a particular garment looks on their body. To enjoy the services offered, users must register and create their profiles. Once in, customers can navigate and explore different brands, access catalogs and place their orders. The system provides the customers with options to search through available brands and shop from them. Before placing orders and making purchases, the customers can use the try-on feature to see how a product looks on them, they can use mix and match feature available with the products to create outfits to see how products from different brands go together. Users acquire accurate body measurements through input, get size recommendations, take quizzes on style, and receive personalized product recommendations based on preferences. Every time a quiz is taken again, recommendations are updated. Additionally, the system will have access to unique client

data to provide sizing and personalized styling suggestions that can help customers choose chic and well-matched attires. Customers can also turn on notifications for specific items to receive notifications about them specifically to avoid missing sales on their favorite products. On the other hand, the online retailers, brands, can set up their accounts to manage their inventory and orders. Retailers obtain useful facts and information about inventory tracking, customer behavior, and sales trends. In-depth analytics, sales, and stock updates are provided by the sales predictor in the system to support proactive decision-making. Moreover, system will be able to notify the customers about the new offers or sales a brand is offering. Placing and cancelling orders depends on the respective brands policies. The try-on feature is limited to clothes. Furthermore, necessarily not all brands of the country are available to shop from. Lastly, the application is currently operational in Pakistan only.

7. Modules

ALL USERS/SYSTEM BASED

7.1 Module 1: User Management

The User Management module enables users to create accounts, authenticate themselves, and manage their profiles within the application. This module plays a pivotal role in enhancing the user experience by providing a secure and personalized environment for users to interact with the app's features.

FE-1: Register and create an account by submitting credentials.
FE-2: Account security is ensured by using phone or email verification codes for account verification.
FE-3: Mechanisms for password reset that can help users if they lose their login information.
FE-4: Use a password and an email address to sign in and out of a user account.
FE-5: Access and edit profiles, including login, personal, and shop information.

MOBILE CUSTOMER

7.2 Module 2: Customer Profiling & Personalization

A key component of the app that lets users develop and manage different processes while surfing the app is the Customer Profiling module. In order to enhance user experiences, it records and saves user queries and browsing history. By obtaining and analyzing user data, this module provides useful insights into topics that are especially important to some users.

FE-1: Management of profiles, allowing users to add, amend, and manage login information, sizing information for a customized experience.
FE-2: Before checking out, add, remove, and edit the products in the shopping cart.
FE-3: Get alerts when products in the shopping cart, wish list, or explicitly chosen items alter or are on sale.
FE-4: Access to prior search history allows users to quickly and easily locate previously searched products.
FE-5: Make wish lists, manage them, and save and arrange things wanted to be bought later.

7.3 Module 3: Brands Spectrum

This module is an essential part of the Stylize application that attempts to enhance customers' shopping experiences. It gives customers the ability to investigate various styling stores and collections, empowering them to make informed fashion decisions. This module offers a curated and personalized approach to shop discovery by matching customers with their unique interests and stylistic preferences.

FE-1: A designated area within the app with a specific focus where users may discover various styling brands.
FE-2: Comprehensive profiles for every brand, each with a synopsis.
FE-3: A display of the newest and most well-liked styling products from the company.
FE-4: Detailed descriptions of each styling component together with high-quality pictures.

7.4 Module 4: Payment

The Payment module is a vital component of Stylize that is created to give shoppers a simple and safe payment experience whenever they decide to buy something.

FE-1: Integration with well-known and reputable payment gateway to support quick and secure transactions.
FE-2: To accommodate user preferences, provide payment alternatives, including credit/debit cards and other means of payment.
FE-3: Before users finalize their purchase, an upfront overview of the whole cost of the products, inclusive of platform and shipping costs.

7.5 Module 5: Personalized Recommendations

The Personalized Recommendation module of our software, which proposes brands that meet the user's body measurements and provides tailored size recommendations, is a handy component. Through making sure that clients find clothing that is the right size. Additionally, it provides a style quiz that enables users to learn more about their individual style preferences and receive products from all the brands in a list based on the quiz's results. This gives consumers a fun method to learn about their own fashion tastes and get product recommendations that are specifically suited to their personal style.

FE-1: Add or modify physical measures such as weight, height, chest, waistline, hips, wrist, and foot for examination.
FE-2: Consult sizes for specific products based on their sizing charts.
FE-3: Complete a style quiz on buyer's personal style preferences, including preferred colors, types of apparel, and sources of inspiration.
FE-4: Receive product recommendations in line with the user's tastes that rely on the quiz results.
FE-5: Updated product recommendation list based on each new quiz retake.

7.6 Module 6: Mix and Match Studio

The module is made to make creating outfits for users simple. Users have access to a special space called the Mix and Match Studio where they may express their creativity and put together outfits utilizing styling pieces, from various brands in their inventory. Giving people the ability to

experiment with their design choices while providing an intuitive outfit creation experience is the focus of this module.

FE-1: Provision of an option to add styling pieces to the Mix & Match inventory from the product description page.
FE-2: Users get access to an exclusive space within the Mix and Match Studio so they can put together ensembles using the styling items they have in their wardrobe. Users can mix and combine styling pieces on the screen to create looks by having access to their whole wardrobe.
FE-3: Categorized wardrobe to make it simple for users to select products for outfit building. Additionally, saved objects have categories for easy selection.
FE-4: Provision of swiping inventory for customers to put together outfits by using swipe functionality.
FE-5: Smooth transfer from the Mix & Match Studio to the retailer's shop to make a purchase of the chosen apparel.
FE-6: Management authority over the Mix and Match Studio. This involves organizing and maintaining the inventory of attire by adding/removing each item.

WEB RETAILER

7.7 Module 7: Digital Catalog

For sellers, the Digital Catalog module is an essential asset that gives them complete control over the stock of accessible products. Retailers may organize, keep track of, and present their product catalog using this module, which also simplifies inventory tracking. This module simplifies the procedures for adding product photos, writing in-depth product descriptions, establishing prices, and controlling stock levels.

FE-1: An instantaneous summary of the products' stock levels.
FE-2: Access to comprehensive product details, including variations like size, color, or style.
FE-3: Tools that are simplified for mass inventory updates, such as adding new products, editing, disabling products or changing quantities.
FE-4: Reliable levels of stock adjustments with each sale through the seamless connection via the order management module.
FE-5: Create organized categories to make it simple for customers to navigate and locate items in the catalogue.
FE-6: Enter the product's title, description, category, pictures, and characteristics.
FE-7: Track available stock in while entering and updating quantities of stock for each product.
FE-8: Set pricing of products (regular and sale prices).

7.8 Module 8: Orders Management

The essential center for sellers to effectively monitor and manage incoming orders is the Order Management module. With the help of this crucial module, sellers are better equipped to control order status, simplify shipping procedures, and efficiently handle cancellation and refund requests from customers. It forms the basis for effective inventory control, product listings, and order processing.

FE-1: A thorough breakdown of all new orders, including order specifics, client data, and order status.
FE-2: Having access to tools for effectively managing and processing orders, such as those for canceling, modifying, or approving them.
FE-3: Automatic order status alerts to update buyers on their orders' progress.

7.9 Module 9: Analytics and Reports

The Analytics and Reports incorporate features that give retailers insightful information about their sales patterns, clientele, and general performance indicators with the help of sales and stock data. With the use of this knowledge, they are better able to manage their inventories, focus their marketing efforts, and compete in their industry.

FE-1: Extensive examination of sales information, including income, profit margins, and volume of sales over time.
FE-2: Comparison of revenue performance across various items and categories to pinpoint high- and low-performing regions.
FE-3: Inventory tracking helping to keep an eye on stock levels, spot out-of-stock or slow-moving items, and avoid overstocking.
FE-4: Having access to reports and dashboards with eye-catching visuals that offer a clear overview of trends.
FE-5: Potential Stock spike or dip alerts and notifications that facilitate proactive decision-making.

7.10 Module 10: Virtual Try-On

The Virtual try-on, as the name suggests offers a virtual fitting room that uses AR technology to provide buyers with an experience of trying on clothes as they do in stores, cutting their hassle and reducing returns/exchanges rates. The try-on feature available with the products lets the buyers to examine how a styling product looks on their body.

FE-1: Provision of virtual try room to try-on specific products.
FE-2: Body scanning by standing in front of the camera to try-on clothes.
FE-3: Superimposition of product images to fit clothing.

7.11 Module 11: Admin Management Dashboard

The Admin Management Dashboard is a comprehensive module that enables admins to oversee and manage user accounts, set up payment details, and track platform earnings with ease. In order to improve platform governance generally, this module equips administrators with effective tools for user account management and safe payment setup.

FE-1: View detailed information of all buyers and retailers account.
FE-2: Easily impose restriction on user accounts.
FE-3: Streamline interface for admins to safely set up and manage payment information.
FE-4: Take down all the relevant banking data, such as the account title, card number, IBAN, and more.
FE-4: Gain Insight into financial earnings.

8. System Limitations/Constraints

LI-1: Placing and cancelling orders entirely depend on the respective brand's policies and procedures.
LI-2: Necessarily not all brands are registered for the customers to access and shop from.
LI-3: Currently, the system is operational in Pakistan only.
LI-4: Without internet, the application cannot be accessed and notifications cannot be received.
LI-5: Only certain clothes will be available to try on virtually.

9. Data Gathering Approach

The requirements and information are gathered through online research by reviewing existing online shopping platforms to extract functionalities and challenges. Further, questionnaires were distributed among the targeted audience, the online retailers and customers, to gather their opinions and needs about the online shopping world. The combination of both approaches provided a comprehensive understanding of the features and requirements for the implementation of the proposed system.

10. Tools and Technologies

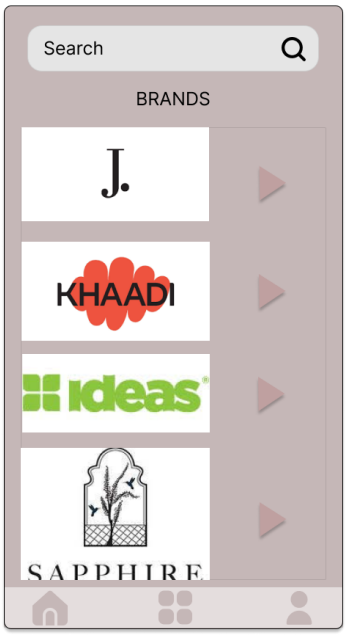
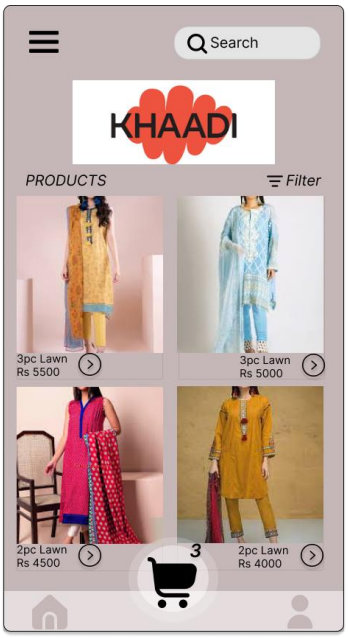
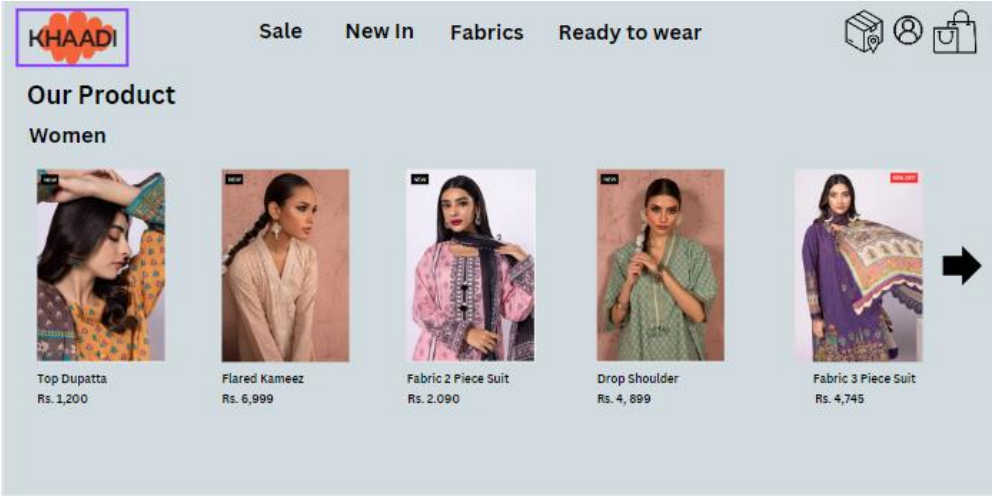
14. Mockups

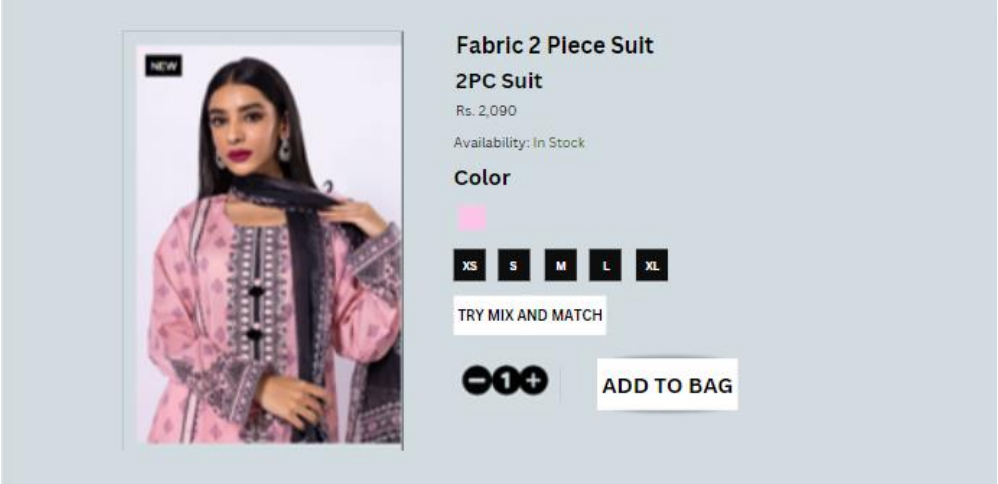


Description: This screen shows different clothing brands/retailers that are registered with the application. Customers can search or scroll through to visit the brand they wish to shop from.





Description: This screen shows a page of a particular brand offering variety of their ready-to-wear outfits. Customers can scroll to select the item they want to try and/or purchase. They can also filter clothes for ease and use the menu given at the top-left to shop category wise.



Description: This screen shows when a particular item is selected to preview before purchasing. This includes product images and all the associated information. Customer can mix and match their outfits and accessories and/or add the product to their cart by clicking on the respective buttons.

Description: The screen shows the mix and match section in which user can put different outfits and accessories together to make a complete outfit and if they like it, they can purchase the combination they made.

Description: This screen pops up when customer clicks on the try virtually button. This screen basically is a camera that opens up and starts scanning the customer's body to show how the product will look on them. Customer can rotate 360 and check all the fittings in an AR environment.
